## **XLlibs Crack+ Full Version X64**

===== XLlibs is a header-only library, built in C++, that provides the basic utilities and functionality required by all X-Windows applications. It is designed to work well as a public header-only library, and as such does not implement any internal interfaces that could only be used by a particular version of the XLlibs library. The current development version of XLlibs is 0.9.6, which supports the latest version of the X Windows Client (version 3.3 and later). The functions provided in this library are the basic minimum required to develop a cross platform X Windows Client application. This includes operations for setting graphics modes, setting window backgrounds, and setting mouse pointers. XLlibs is provided as a header-only library, to ensure that the library can be included and used in projects without having to compile it on their own. Users can download the latest development version of XLlibs here: XLlibs Requires: ===== XLlibs requires the following two header files: libX11.h -- Required by all X Windows applications. xutil.h -- Required by XWindows applications that use XLlibs for their operations. Version History: ===== Version History ----- - Version 0.8.0 - First Release - Version 0.8.1 - Added to library directory. - Version 0.8.2 - Removed unneeded global constants. - Version 0.8.3 - Updating library build, re-adding XFontDatabase.h and XBrush.h. - Version 0.8.4 - - Added XSetIconName. - Minor code cleanups. - Fixed library build. - Miscellaneous internal improvements. - Removed all static library builds. - Removed all configuration-building code. - Removed all unused global functions. - Added XLlibsLib.cpp to handle internal interface declarations (and thus standard C++ build). - Modified configure.in to properly handle library requirements. - Modified install.sh to handle configuration properly. - Modified lib/Makefile.am to properly handle the library dependencies. - Fixed lib/Makefile.am to remove X11/Xutil.h if libx11-1.3.1-dev

## XLlibs Crack+

=====  
XLlibs provides classes that provide a common interface to functionality on different hardware platforms. This includes things like: 1. X11 functions 2. Functions from popular X11 libraries 3. The rest of the X11 api This library is especially useful for applications that are cross platform, or when using different X11 libraries for different platform environments. ## What's New in the XLlibs?

=====  
XLlibs implements a shared library and a collection of generic data structures that have been ported to Linux. XLlibs supports a C/C++ interface, as well as a Java/Objective-C interface. The XLlibs API consists of a core library, user specific headers, a client interface, and a Java client implementation. The core library defines the following public and protected types: \* `struct \_XLlibs\_Client \*client\_ref;` -- A reference to a client. \* `struct \_XLlibs\_Namespace \*namespace\_ref;` -- A reference to a namespace. \* `struct \_XLlibs\_Namespace \*g\_xlibs\_ns;` -- The global namespace. \* `struct \_XLlibs\_Namespace \*client\_ns;` -- The client's namespace. \* `struct \_XLlibs\_Namespace \*global\_ns;` -- The global namespace. \* `struct \_XLlibs\_Namespace \*event\_ns;` -- The namespaces for global, client, and event events. \* `struct \_XLlibs\_Namespace \*struct\_ns;` -- A namespace for user structs. A client is a reference to a namespace. Each namespace is a unique collection of information. The global namespace contains global namespace variables and a event namespace, which is used to subscribe to events. The client namespace contains all the client-specific namespace variables. The client event namespace is for use in client events. The user namespace is a free form, namespace that can be used to store application specific information. An event namespace is a collection of variables used to subscribe to events. An event namespace can be used by a client to receive information about events. The client event namespace is used in XLlibs client events. The server event namespace is used in XLlibs server events. The following types are members of the namespace types: \* `client\_ref->client\_data;` -- The client data. \* `client\_ref->clients;` -- A vector of clients. \* `client\_ref->server\_event\_handlers;` -- A vector of server event handlers. \* `client\_ref->event\_handlers;` -- A vector of client event handlers. \* `client\_ref->sig\_id;` -- The client's global identifier. \* `client\_ref->guest;` -- The client's guest identifier. \* `client\_ref->auth\_type;` -- The client's authentication type. \* `client\_ref->namespace;` -- The client's namespace. \* `client\_ref->pass;` -- The client's password.
