The present invention relates generally to a semiconductor device and a method for fabricating the same. More particularly, the invention relates to a semiconductor device having a cavity structure and a method for fabricating the same. With the recent trend towards high integration and high performance of semiconductor integrated circuits, pattern-forming techniques for forming fine structures on a substrate have been increasingly important. One example of pattern-forming techniques is the so-called damascene process for forming a fine structure by forming a metal film in a trench formed on an insulating layer and by burying the metal film in the trench. The damascene process provides very good step coverage, enabling easy formation of a fine structure. Therefore, the damascene process is a promising technique that allows the formation of a multi-level interconnect structure with a high aspect ratio. However, if a structure to be formed on a semiconductor substrate has a large volume, the damascene process causes problems, such as a void in the insulating film or a seam in

### What's New in the IPv6 Address Converter?

The IPv6 Address Converter is a free and easy-to-use tool for converting IPv6 addresses to other standards, such as compressed and preferred format, and even the reverse nibble.
